

S. No.	Topics to be covered	Lectures	Planned Date	Actual date of the lecture taken	CO	Text /reference book /Additional Lecture Link
UNIT -1 (Introduction in Python)						
1	Write a Python program that: • Stores your name, age, and whether you're a student in separate variables. • Prints them all with clear labels.	1			BCC302.1	T1, T2
2	Write a Python program that: • Takes two numbers (you can assign them manually), • Performs and prints the result of addition, subtraction, multiplication, division, and modulus.	1			BCC302.1	T1,T2
UNIT-2 (PYTHON PROGRAM FLOWCONTROL CONDITIONAL BLOCKS)						
1	Write a Python program that asks the user to enter a number.(Use if ,elif and else to check if the number is positive ,negative or zero.	1			BCC302.2	T2, T4, T5
2	Write a python program that does the following : 1)Use a for loop with range to print numbers from 1 to 10. 2)Inside the loop skip printing even numbers using continue.	1			BCC302.2	T2, T4, T5
UNIT-3 (Python Complex Data Types)						
1	Write a Python program to perform basic operations on strings, lists, and tuples. The program should allow	1			BCC302.2 /BCC302.3	T3, T4

	users to: 1. Accept a sentence and display various string manipulation results like length, slicing, case conversion, finding substrings, etc. 2. Create a list of numbers or items, perform list slicing, appending, inserting, and removing items. 3. Define a tuple with at least 5 elements and demonstrate access using indexing and slicing.					
2	Write a Python program that uses dictionaries and functions to store and process student information. The program should: 1. Use a dictionary to store student names and their marks. 2. Perform dictionary operations like adding a new student, updating marks, deleting entries, and displaying all records. 3. Define and use functions for organizing code, such as: function to add a student, function to calculate average marks, function to display student details	1			BCC302.3	T3, T4
UNIT -4 (Python File Operations)						
1	Write a Python program to open a text file and demonstrate the use of read(), readline(), and readlines() functions.	1			BCC302.4	T1,T3,T6

2	Write a Python program to create a text file and write multiple lines into it using write() and writelines().	1			BCC302.4	T1,T3,T6
UNIT-5 (Python packages)						
1	Data Visualization, Analysis using Matplotlib, Pandas and NumPy	1			BCC302.5	T1, T5, T6
2	Implement Tkinter and Python Programming for calculators.	1			BCC302.5	T1, T5, T6
