RATIO AND PROPORTION

IMPORTANT FACTS AND FORMULAE

Ratio: The ratio of two quantities a and b in the same units is a fraction that one quantity is of the other. Thus, $\frac{a}{b} = a : b$.

In $a : b$, we call a as **antecedent** and b as **consequent**.

Rule: The multiplication or division of each ratio term by the same non-zero number does not affect the ratio.

Thus, 3: 5 is the same as 6: 10 or 9: 15 or 12: 20 etc.

Proportion: The equality of two ratios is called proportion.

As $2 : 3 = 6 : 9$, we write, $2 : 3 :: 6 : 9$ and we say that 2, 3, 6, 9 are in proportion. Here 2 and 9 are called **extremes** while 3 and 6 are called **means**.

In a proportion, **Product of extremes = Product of means**.

- (i) If $a : b :: c : d$, then d is called the **fourth proportional** to a, b, c .
- (ii) If $a : b :: b : c$, then c is called the **third proportional** to a, b .
- (iii) **Mean proportional** between a and $b = \sqrt{ab}$.

SYLLOGISM

Candidates can find various tips and syllogism logical reasoning tricks from below for solving the questions in this section.

Tip # 1: If a definite conclusion is false in any of the possible diagrams, then the definite conclusion is considered to be false.

Tip # 2: If all statements are positive, then all negative conclusions will be false in definite cases and vice versa.

Tip # 3: Subject and Predicate can interchange for the complementary pair “Some + No”

Tip # 4: In a syllogism reasoning problem, if two conclusions have the same subject & predicate and consist of a complementary pair but only one of the conclusions is true, then it will not form an either-or case. Do not consider “Some + Some” as a complementary pair for Either or case.

Tip # 5: If a possible conclusion is true in any one of the possible diagrams, then the possibility is considered to be true.

Tip # 6: “Only a few” means both conclusions are definitely true.

Therefore, the conclusion, some A are B and some A are not B will be definitely true.

Tip # 7: In a syllogism reasoning problem, complementary pairs for Either or case are, “Some + N” and “All + Some not”

Tip # 8: Both conclusions should consist of one of the above complementary pairs. Subject and Predicate of the two conclusions should be the same and they cannot interchange. The answer of both the conclusions should be can't be said.

Tip # 9: Candidates need to keep the following things in mind while solving the syllogism based questions.

PARTNERSHIP

IMPORTANT FACTS:

Partnership: When two or more than two persons run a business jointly, they are called partners and the deal is known as partnership.

Ratio of Division of Gains:

i. **Simple Partnership:** A simple partnership is the one in which the capitals of all the partners are invested for the same time. In this partnership, the gain or loss is distributed among the partners in the ratio of their investments.

Suppose A and B invest ` x and ` y respectively for a year in a business, then at the end of the year:

(A's share of profit) : (B's share of profit) = x : y.

ii. **Compound Partnership:** A compound partnership is the one in which the capitals of the partners are invested for different time periods.

In this partnership, the equivalent capitals are calculated for a unit of time by taking (capital × number of units of time). Now, gain or loss is divided in the ratio of these capitals.

Suppose A invests ` X for P months and B invests Y for Q months, then

(A's share of profit) : (B's share of profit) = XP : YQ

iii. **Working and Sleeping Partners:** A partner who manages the business is known as a working partner and the one who simply invests the money is a sleeping partner.
